Flight Hologram
how it was made + the prompt

The exact prompt behind the Goa flight reel: a 3D India hologram over a real plane-window clip, driven by the GPS my phone hid inside the videos.

WHAT MY PHONE SAVED (ALL REAL)

- **10:39, Delhi runway:** 782 ft
- **12:08, about 34 km from Nashik:** 38,282 ft, with no signal
- **13:10, Goa airport:** 155 ft
- **16:41, Goa beach:** 6 ft

Every number on screen came from the files themselves. Nothing was guessed.

THE QUICK WAY, NO CODE

Open **thenispace.com/flight** and pick your own flight video or photo. It shows your altitude, position and time on a 3D map. The file is read on your phone and never uploaded.

WHAT YOU NEED FOR THE FULL REEL

- **Claude Code** (the desktop app or the terminal). It installs the free tools it needs: ffmpeg, Python and Node.
- **Your original phone files** from one trip: take-off, the window at cruise, the landing, the destination.
- **iPhone:** share them with **Options, All Photos Data** turned on, or the location is removed.
- **Android:** Camera, Settings, **Location tags** must have been on.

THE PROMPT

Put your files in a folder called `flight`, open Claude Code in the folder above it, and paste this. Change the country, the cities and the text for your own trip.

```
Make me a 15 to 20 second vertical reel (1080x1920, 30 fps) from my own
flight videos, with a 3D hologram of my route that uses the real GPS my
phone saved inside the files.

MY FILES
- The folder ./flight has my phone videos and photos from one trip:
  take-off, the plane window at cruise, the landing, the destination.
- iPhone videos are HDR (HLG). Convert them to normal SDR colour first,
  or everything will look washed out.

STEP 1: READ THE HIDDEN GPS
- For every file read the location tag. In MOV/MP4 it is the ISO 6709
  string (com.apple.quicktime.location.ISO6709 or ©xyz): latitude,
  longitude and altitude in metres. In JPEG/HEIC read the EXIF GPS.
  Also read the creation time.
```

```
- Print a table: file, time, latitude, longitude, altitude in feet,
  nearest big city.
- Use only these real numbers on screen. If a file has no tag, tell me.
  Never invent an altitude, a speed or a place.

STEP 2: THE HOLOGRAM (three.js, rendered frame by frame)
- A map of India from an open dataset with the official outline (credit
  its licence) as a glowing cyan hologram: soft blue fill, a fine dot
  pattern, a bright coastline, faint state lines.
- Tilt it about 40 degrees back so it floats above the clouds, and turn
  it slowly.
- Draw my route through the real GPS points as an amber arc above the
  map, with a small white plane where the cruise video was taken and a
  thin line dropping from the plane to the map.
- Under the map, a projector ring on the cloud layer with light rising
  to the map, and an amber arc for the share of the trip done.
- Render it on black with additive light only, so it can be composited.

STEP 3: PUT IT IN THE REAL WINDOW
- Use the cruise window clip as the base. Track the camera on the clouds
  (optical flow, rotation only) and move the hologram with it, so it
  stays locked in the sky instead of stuck to the screen.
- Composite it like real light: screen blend, a soft bloom, slightly
  darken the clouds behind the hologram so it reads, let the brightest
  cloud tops cover the bottom of the ring, and let the clouds catch a
  little cyan glow. The wing, engine and window frame stay in front.
- Warm the clouds a little and keep the sky navy so the cyan pops.

STEP 4: THE STORY
- Open on the best moment: a 2-second zoom into the destination on the
  map as the plane reaches it, then cut to the real take-off.
- Over the cruise clip the hologram builds up, the altitude counts up to
  the real number, the clock runs from take-off to the cruise time, and
  the plane moves along the route.
- Zoom into the destination pin, open it like a portal, and land in the
  real destination clip with its real altitude.
- Short text in the upper middle of the screen, one line at a time:
  "NO SIGNAL.", then the time and place of each GPS point.
- Quiet music, soft clicks only.

OUTPUT
- final.mp4 at 1080x1920 and a cover with the two biggest numbers.
- Before you render everything, show me one finished frame and wait for
  my OK.
```

HOW THE REEL WAS MADE

- **Claude Code** wrote and ran everything.
- **three.js** drew the hologram. **Python and OpenCV** tracked the camera and blended the light. **Chrome** rendered the text, and **ffmpeg** cut the video.
- The map is the open @svg-maps/india outline (CC BY 4.0).
- No AI video. An AI video tool misspelt the words and drew India wrong, so every frame here is real footage plus code.

TIPS

- Pick a clip where the camera moves slowly. The hologram locks on better.

- Use trip places only. Never post a file that shows where you live.
- Post at 8 PM and ask people where their last flight was.
