26 Lakh Diyas prompt

The exact prompt behind the Diwali page from the reel: 26,17,215 diyas, every flame in code.

THE PROMPT

Written for the DIYA page. Change the greeting, the count and the brand line for your own.

```
Build DIYA: a single-file index.html Diwali page. A river ghat at night
where Ayodhya's Deepotsav record, 26,17,215 diyas, lights up with a live
counter, then fireworks and a golden "Happy Diwali". Every flame is code:
no video, no images.

STACK
Three.js r160 from CDN (importmap, with three/addons/ for EffectComposer,
RenderPass, UnrealBloomPass and OutputPass) + GSAP 3.12. Google Fonts:
Inter Tight for the UI, Great Vibes for the greeting, Tiro Devanagari Hindi
for शुभ दीपावली, Instrument Serif italic for the "from" line.

THE SCENE
- A near-black night (#03040a) with 700 faint blue-white stars far away.
- The camera sits in a boat at the near end of a ghat: steps rise out of
the river on the right and the bank runs away to the horizon. Camera at
(0.15, 0.62, 0) looking at (-2.2, 1.55, 26), fov 42 (64 on tall phone
screens), drifting slowly forward with a gentle sway.
- ACES tone mapping, a HalfFloat EffectComposer with UnrealBloom (strength
~0.4, radius 0.55, threshold 0.85) and an OutputPass.

26,17,215 DIYAS, ALL ON THE GPU
- One BufferGeometry for 26,17,214 diyas (diya #1 is the clay hero diya
below): 40 steps, 3 rows per step, step rise 0.15, step run 0.32, 0.12
spacing along the bank, the bank curving gently left far away, a little
seeded jitter. That is about 65,000 diyas per step over about 2.6 km.
- Store the points in lighting order: the bottom step first, racing away
along the water, then the next step up, and so on. Give every point its
diya number as an attribute. "Light the first N" is then just aId < uLit in
the vertex shader, and the counter shows exactly how many are lit: 1,000 is
a line along the water, 1 lakh fills the first step to the horizon, 26 lakh
fills the whole ghat.
- Keep it smooth on phones: far away most diyas are smaller than a pixel,
so merge those. Keep each one with a chance of 3 × its brightness and draw
the kept ones brighter by the same factor. Near diyas are all kept. The
screen gets the same light from about 19x fewer points. Draw only the lit
ones (setDrawRange), use a pixel ratio of 1.5 on phones, and use no
backdrop blur. It runs at 60 fps on a phone.
- A custom GLSL3 ShaderMaterial with additive blending and no depth write.
Point size = scale × 0.045 / distance (clamped 1 to 46 px). Alpha = min(1,
size × size × 0.6), so far, sub-pixel diyas add only their share of light
and the horizon never blows out into a white blob. A soft wave front where
```

the newest diyas fade in. Every flame flickers on its own (a hash of the vertex id). A warm flame shape: gold core, orange halo.
- Draw the same geometry again mirrored under the water (y flipped), wobbling, stretched and dimmer: the reflections.

THE HERO DIYA (#1)
- A terracotta clay diya from LatheGeometry, an oil disc and a small wick, floating near the boat and bobbing on the water.
- A shader flame on a camera-facing plane (swaying, white-hot core, orange body), a warm point light, and a soft wavy streak of its reflection on the water.
- It lights first, before the counter moves.

THE COUNTER
Top left: a "DIYAS LIT" label, a big gold tabular number in Indian format (Intl.NumberFormat("en-IN"), so 26,17,215), and a small note "Ayodhya's record, Diwali 2025: 26,17,215".

THE CELEBRATION (when the count reaches 26,17,215)
- Fireworks over the ghat, on the GPU: 12 bursts (gold, saffron, rose, white) at seeded times over about 5 s, 520 sparks each with a 4-point fading tail, a rocket trail climbing from the ghat before each burst, a fast burst that then slows with drag and gravity, white-hot at the moment of the burst, a crackle flicker, and their reflections in the river. For visitors the show loops every 6 s.
- 46 sky lanterns rising and swaying off the ghat.
- The bloom rises a little.
- A centred greeting fades in as the counter fades out: "शुभ दीपावली" in Tiro Devanagari, then "Happy Diwali" huge in Great Vibes with a gold gradient text fill, a light shine sweeping across it and a warm glow, and a "from {name}" line in Instrument Serif italic when the URL has ?name=.

THE STORY FOR VISITORS (one GSAP timeline)
- 0.8 s: the hero diya lights (1). 2.4 s: 1,000. 4.0 s: 1 lakh. 6.0 s: all 26,17,215, accelerating. 9.0 s: the celebration. 10.6 s: the share bar slides up.
- The share bar (bottom centre, a dark glass pill): a "Your name" input and a gold "Send to family" button. Tapping it shows "from {name}" on the card at once and builds a link with ?name=. It opens the phone's share sheet (navigator.share). Laptops and Instagram's in-app browser on Android have no share sheet, so there it opens WhatsApp (wa.me) with the message, puts the link on its own line and copies the link.
- A small "Every flame is code" line bottom right.

ALSO
- window.lightTo(n, duration, ease), window.finale() and window.reset() so the page can be driven for a screen recording. ?still turns off the autoplay, ?lit=N and ?end jump straight to a state.
- Seeded randomness only, so every load looks the same.
- Works on phones (portrait framing) and desktops.
