The Power Shift animation
how it was made + the prompt

No After Effects. The whole reel is a web page that a renderer plays frame by frame: **Claude Code** writes the page, **HyperFrames** turns it into video. Here is the exact workflow, then a prompt you can paste.

THE WORKFLOW (ABOUT 2 HOURS AFTER THE VOICE IS RECORDED)

1. **Script as a table.** One row per spoken line: `line | what is on screen`. Context first (what happened), then the system, then the result, then what changes, then "for India", then the date. 20–25 lines, 2:45–3:15.
2. **Research the genre, then design something else.** We pulled frames from the best explainer on the topic, wrote down what works (one idea per card, a caption line, faces), and built a different skin: black "control room" HUD, cyan dot-matrix, wireframe US map that draws itself, photos in scanner brackets, typewriter captions, a `01/07` chapter readout.
3. **Legal photos only.** Official US-government portraits are public domain; the rest from Wikimedia Commons with CC licences (credits in the caption).
4. **Build in HyperFrames.** Each line is one scene (`class="clip" data-start data-duration`), one paused GSAP timeline, everything a function of time (no randomness, no timers). Data moves: 435/100 LED grids fill, states flip on the real SVG map, counters roll, bars update.
5. **Voice.** Phone recording, each line twice; a script splits it by silence and keeps the better take. Whisper gives word times; captions follow the words.
6. **Sound.** Small UI ticks and whooshes on the motion, a quiet synth pad (ACE-Step, local, royalty-free) ducked under the voice, mix at −15 LUFS.
7. **Check → render.** `npx hyperframes check` (lint, contrast, overlaps, motion) → render 4K vertical. Two cuts: Instagram under 3:00, YouTube over 3:00 (so it is a main video, not a Short).

PROMPT (PASTE INTO CLAUDE CODE, IN A FOLDER WITH `NPX HYPERFRAMES INIT` DONE)

```
Build a 1080×1920 HyperFrames explainer reel on [TOPIC], Hinglish, ~2:50,
from this script table:
[paste your table: line | on screen]

Look — "control room" HUD: background #06080b with a faint cyan dot-matrix,
accent cyan #19e6ff, secondary amber #ffb020,
JetBrains Mono for labels and captions, Archivo Black for headlines.
Persistent chrome: top-left "NIS://[TITLE]_" with a blinking
cursor, top-right "● LIVE · [DATE]", a chapter readout "01/07 [CHAPTER]", a
footer with the handle. A scan line sweeps and a
glitch-slice cut on every scene change.

Rules: one scene per script line, class="clip" with data-start/data-
```

```
duration, a single paused GSAP timeline registered on
window.__timelines, transforms/opacity only (no top/left/letter-spacing
tweens), deterministic (no Math.random/Date.now/timers).
Captions: a terminal-style line at the bottom that types itself (per-
character spans), key words in amber, timed to the
voice (use whisper word timings when I give you the audio). Photos in
scanner-bracket frames that scale 1.25→1 while the
four brackets fly in. Show data as motion: dot grids that fill with ticking
counters, SVG map regions that light up with a pop,
split bars, meters, calendar flips. Use only public-domain or CC-licensed
photos and list credits.

Deliver: npx hyperframes check passing, a contact sheet of every scene,
then render --resolution portrait-4k.
Make two cuts: Instagram (<3:00, drop the weakest lines) and YouTube
(>3:00).
```

TOOLS (ALL FREE EXCEPT YOUR TIME)

- Claude Code (claude.com/claude-code) · HyperFrames (`npx hyperframes init`) · GSAP · Whisper via `npx hyperframes transcribe`
- Photos: commons.wikimedia.org (filter by licence) · Music: ACE-Step 1.5 (local, MIT) · Edit sounds: any CC0 UI pack
