The Chai Stall Website
the prompts + the 3 skills

Everything behind the reel: a made-up ₹10 chai stall, launched like a flagship phone. The same setup works for any small shop.

SEE IT FIRST

Open **thenispace.com/tapri** on your phone and scroll. The stall and its jokes are made up. The website is real.

WHAT YOU NEED

- **Claude Code** (the desktop app or the terminal).
- **Three free Claude skills.** The install lines are below.
- **Photos of your product**, your own or AI-made. The chai stall photos were made with AI.
- **For the video only:** one minute of your own monitor filmed in a dark room, with a black screen.

INSTALL THE 3 SKILLS

Open a terminal in your project folder and run these two commands. They need Node.js. If `npx` is not found, ask Claude Code to install Node for you.

```
npx -y skills add MengTo/Skills \
  --skill build-awwwards-quality-sites \
  --agent claude-code -y

npx -y skills add emilkowalski/skills \
  --skill emil-design-eng --skill animate \
  --agent claude-code -y
```

- **build-awwwards-quality-sites** by Meng To: art direction, the hero, scroll scenes, the premium look.
- **emil-design-eng** by Emil Kowalski: the small details that make motion feel right.
- **animate** by Emil Kowalski: how each animation should move and how long it should take.

PROMPT 1: THE WEBSITE

Open Claude Code in your project folder and paste this. Fill in the brackets.

```
/build-awwwards-quality-sites

Build a single-page scroll website for my small shop, launched like a
flagship phone.

MY SHOP
- Shop name: [your shop]
```

```
- What I sell and the price: [for example, cutting chai, ₹10]
- The product name, said like a flagship launch: [for example, Cutting Chai
Pro]
- One short tagline: [for example, Forged in mitti.]
- Where it is and the timings: [for example, Gate No. 2, next to the bus
stop,
  open till the last bus]

THE LOOK
- Black stage, huge tight headlines, one big photo per idea.
- Hero: "New", the product name, the tagline, the price, an Order button
and
  one large photo of the product on black.
- Then these sections, each a pinned scroll scene:
  1. What it is made of: a close-up texture photo and three short lines.
  2. The secret ingredient presented like a processor chip, with three
     funny stats.
  3. Four finishes: the four variants, one photo each, one funny line each.
  4. One giant number that counts up on scroll, with a fine-print joke.
  5. A compare table: the normal product against the Pro.
  6. Visit the flagship store: a night photo of the real place.
- End with a call to action.

THE WRITING
- Write everything like a serious tech launch, about my very small shop.
  Short, deadpan, no exclamation marks.

THE RULES
- GSAP with ScrollTrigger, and Lenis for smooth scroll.
- One static folder that I can host anywhere.
- It must work on a phone.
- Never use another brand's logo or product names on the page.
- If a photo is missing, tell me exactly which photo to take or make.
- Show me the hero first and wait for my OK before building the rest.
```

PROMPT 2: THE CURSOR VIDEO

Run this after the website is finished.

```
/animate /emil-design-eng

Make a 40 to 45 second vertical video (1080x1920, 30 fps) of a swarm of
256 cursors building my website from nothing, shown on my own monitor.

THE RULE
A cursor must never point at something that already exists. Every object's
size, text, fill or position must come from the same value that moves its
cursor, so the cursor is visibly the cause. A cursor with nothing to do
leaves the screen. No section is ever shown twice.

THE STORY
1. A Claude Code box on a black screen. Type the three skill names, then my
   brief. Press Enter.
2. Every typed letter turns into a cursor. The swarm spells my price, then
   bursts.
3. A zoomed-out canvas with one artboard per section. Each object is
dragged
```

```
   out as a grey wireframe block by its own cursor, with a live W x H
label.
4. Fly into each artboard and make it, with a different action each time:
   - Headlines typed letter by letter with a caret, several cursors typing
     different words at once.
   - The pen tool traces the real outline of my product photo, anchor by
     anchor, then a fill click pours the real photo in from the bottom.
   - One click of the fill tool floods a section with a texture.
   - Two cursors take opposite corners of a photo and pinch it into place.
   - Cursors carry products in and drop them into slots.
   - A slider drag is what counts a number up.
5. Zoom out. Everything is finished. All cursors rush to a Publish button
   and click it.
6. A few seconds of the real site scrolling.
7. The last line is typed on black, and the swarm spells the word I want
   people to comment.

HOW TO BUILD IT
- One HTML page at 1280x758 where every frame is a pure function of time:
  window.__seek(t).
- Simulate the cursors once at load with springs and seeded random numbers,
  and store their positions.
- Render every frame with headless Chrome at double resolution, then join
  them with ffmpeg.

PUT IT ON MY REAL MONITOR
- ./monitor.mov is my monitor filmed in a dark room with a black screen.
  iPhone clips are HDR, so convert to SDR first.
- Track the four corners of the black screen on every frame with OpenCV,
  smooth them, and warp the page into that shape.
- Add a little glow and light from the screen. Keep my real room. Never
  redraw or fake any part of it.

TEXT AND SOUND
- Short captions in the upper middle of the frame, above the monitor.
- Quiet music, and a soft click on each cursor action.

Before you render everything, show me a short video preview and wait for
my OK.
```

HOW THE REEL WAS MADE

- **Claude Code** wrote the website and the whole video.
- The **cursors are an animation** made for the reel. They show the idea of a build. They are not a recording of the real build.
- **Photos:** made with AI. **Music:** made locally with ACE-Step.
- **Chrome** rendered each frame, **Python and OpenCV** put it on the real monitor, and **ffmpeg** joined it.

TIPS

- Write your jokes about real things in your shop. They land better.
- Film the monitor with the phone resting on something, moving very slowly.
- If you use AI photos, turn on the AI label when you post.
